**Impulsive Differential Inclusions** Apr 30 2021 Differential equations with impulses arise as models of many evolving processes that are subject to abrupt changes, such as shocks, harvesting, and natural disasters. These phenomena involve short-term perturbations from continuous and smooth dynamics, whose duration is negligible in comparison with the duration of an entire evolution. In models involving such perturbations, it is natural to assume these perturbations act instantaneously or in the form of impulses. As a consequence, impulsive differential equations have been developed in modeling impulsive problems in physics, population dynamics, ecology, biotechnology, industrial robotics, pharmacokinetics, optimal control, and so forth. There are also many different studies in biology and medicine for which impulsive differential equations provide good models. During the last 10 years, the authors have been responsible for extensive contributions to the literature on impulsive differential inclusions via fixed point methods. This book is motivated by that research as the authors endeavor to bring under one cover much of those results along with results by other researchers either affecting or affected by the authors' work. The questions of existence and stability of solutions for different classes of initial value problems for impulsive differential equations and inclusions with fixed and variable moments are considered in detail. Attention is also given to boundary value problems. In addition, since differential equations can be viewed as special cases of differential inclusions, significant attention is also given to relative questions concerning differential equations. This monograph addresses a variety of side issues that arise from its simpler beginnings as well.

*An Introduction to Difference Equations* Feb 09 2022 This book grew out of lecture notes I used in a course on difference equations that I taught at Trinity University for the past five years. The classes were largely populated by juniors and seniors majoring in Mathematics, Engineering, Chemistry, Computer Science, and Physics. This book is intended to be used as a textbook for a course on difference equations at the level of both advanced undergraduate and beginning graduate. It may also be used as a supplement for engineering courses on discrete systems and control theory. The main prerequisites for most of the material in this book are calculus and linear algebra. However, some topics in later chapters may require some rudiments of advanced calculus. Since many of the chapters in the book are independent, the instructor has great flexibility in choosing topics for the first one-semester course. A diagram showing the interdependence of the chapters in the book appears following the preface. This book presents the current state of affairs in many areas such as stability, Z-transform, asymptoticity, oscillations and control theory. However, this book is by no means encyclopedic and does not contain many important topics, such as Numerical Analysis, Combinatorics, Special functions and orthogonal polynomials, boundary value problems, partial difference equations, chaos theory, and fractals. The nonselection of these topics is dictated not only by the limitations imposed by the elementary nature of this book, but also by the research interest (or lack thereof) of the author.

**Almost Periodic Solutions of Differential Equations in Banach Spaces** Aug 15 2022 This monograph presents recent developments in spectral conditions for the existence of periodic and almost periodic solutions of inhomogeneous equations in Banach Spaces. Many of the results represent significant advances in this area. In particular, the authors systematically present a new approach based on the so-called evolution semigroups with an original decomposition technique. The book also extends classical techniques, such as fixed points and stability methods, to abstract functional differential equations with applications to partial functional differential equations. Almost Periodic Solutions of Differential Equations in Banach Spaces will appeal to anyone working in mathematical analysis.

**For Every Excuse, There is a Solution** Jan 20 2023 While it is a natural thing to give excuses, this book will be arguing that giving excuses is not good enough. The reason is, that each time excuses come up it is an indication of the possibility to provide solutions. While these opportunities may be hidden in pain, injustices, discrimination, and hatred, it takes seeing beyond excuses to come up with solutions. The way to become significant and make an impact is by providing solutions. But you will never rise to the occasion if all you do is give excuses. You will remain stuck where you are if you keep giving "good excuses." The bitter truth is that no matter how good you think your excuses are, the only thing they are doing for you is keeping you stuck in your present predicament.

**Thinking and Literacy** Jul 02 2021 This volume explores higher level, critical, and creative thinking, as well as reflective decision making and problem solving -- what teachers should emphasize when teaching literacy across the curriculum. Focusing on how to encourage learners to become independent thinking, learning, and communicating participants in home, school, and community environments, this book is concerned with integrated learning in a curriculum of inclusion. It emphasizes how to provide a curriculum for students where they are socially interactive, personally reflective, and academically informed. Contributors are authorities on such topics as cognition and learning, classroom climates, knowledge bases of the curriculum, the use of technology, strategic reading and learning, imagery and analogy as a source of creative thinking, the nature of motivation, the affective domain in learning, cognitive apprenticeships, conceptual development across the disciplines, thinking through the use of literature, the impact of the media on thinking, the nature of the new classroom, developing the ability to read words, the bilingual, multicultural learner, crosscultural literacy, and reaching the special learner. The applications of higher level thought to classroom contexts and materials are provided, so that experienced teacher educators, and psychologists are able to implement some of the abstractions that are frequently dealt with in texts on cognition. Theoretical constructs are grounded in educational experience, giving the volume a practical dimension. Finally, appropriate concerns regarding the new media, hypertext, bilingualism, and multiculturalism as they reflect variation in cognitive experience within the contexts of learning are presented.

**Polynomial Automorphisms** Dec 27 2020 Motivated by some notorious open problems, such as the Jacobian conjecture and the tame generators problem, the subject of polynomial automorphisms has become a rapidly growing field of interest. This book, the first in the field, collects many of the results scattered throughout the literature. It introduces the reader to a fascinating subject and brings him to the forefront of research in this area. Some of the topics treated are invertibility criteria, face polynomials, the tame generators problem, the cancellation problem, exotic spaces, DNA for polynomial automorphisms, the Abhyankar-Moh theorem, stabilization methods, dynamical systems, the Markus-Yamabe conjecture, group actions, Hilbert's 14th problem, various linearization problems and the Jacobian conjecture. The work is essentially self-contained and aimed at the level of beginning graduate students. Exercises are included at the end of each section. At the end of the book there are appendices to cover used material from algebra, algebraic geometry, D-modules and Gröbner basis theory. A long list of "strong" examples and an extensive bibliography conclude the book.
